Transmit high definition video images across hundreds of metres of cable

**Is your company involved in subsea or pipeline inspection.
Or CCTV or security?
Or digital signage or transport video?**

If so you probably have to transmit video images across long distances of low cost coaxial or twisted pair cable.

SingMai are now introducing our improved proprietary aCVi-2 transmission protocol as an **'open standard'**.

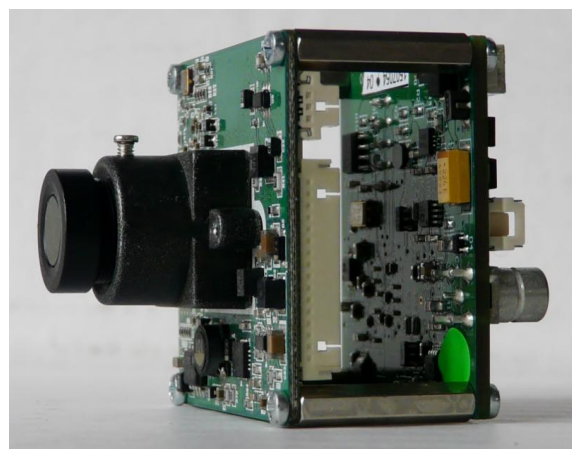

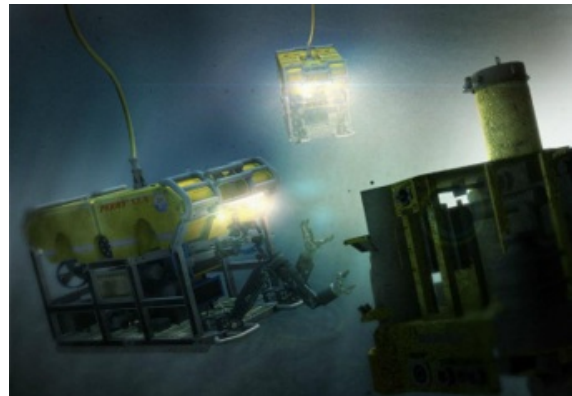

Available as transmission and receiver modules or as intellectual property cores, aCVi transmits high definition video over >300m of coaxial or twisted pair cable.

Connect your video source to our SM06 transmitter module and the output of this module to your cable. At the receiver side connect the cable to our SM08 receiver module and the output to your video recorder or monitor.

No adjustment or setup is required.

For more information on aCVi please follow this link:
